

Swift Ship Tracker — Explanation

Swift Ship Tracker is a shipment-management system used to manage a package from the moment it is created until it is delivered.

How it works

1. Create

- Enter sender and receiver details.
- Add pickup and delivery addresses.
- Enter package details.
- Upload relevant images/documents.
- Create a unique tracking number.

2. Added

- The new shipment is saved in the system.
- Users can view the shipment information and uploaded documents.
- The shipment is ready for pickup.

3. Picked Up

- Pickup staff collect the package.
- The pickup date, time, and location are recorded.

4. In Transit

- The package is transported toward its destination.
- Tracking updates and shipment checkpoints are recorded.

5. Out for Delivery

- The package reaches the destination area.
- A delivery person takes responsibility for the final delivery.

6. Delivered

- The recipient receives the package.
- Delivery confirmation/proof can be recorded.
- The shipment is marked **Completed**.

Simple workflow

Create → Added → Picked Up → In Transit → Out for Delivery → Delivered

The main purpose is to give both the business and customer a **single place to manage shipment details, track progress, and maintain the complete shipment history.**

Swift Ship Tracker

Project Phase Document

1. Project Overview

Project Name: Swift Ship Tracker

Purpose:

Swift Ship Tracker is a shipment management and tracking system designed to help users create shipments, manage shipment information, monitor delivery progress, and maintain shipment records in one centralized platform.

2. Project Phases

Phase 1 – Create Shipment

The Create phase is used to enter and register a new shipment.

Key functions:

- Create a new shipment
- Enter sender details
- Enter receiver details
- Add pickup and delivery addresses
- Enter package information
- Select shipment/service type
- Add shipment date
- Generate a unique tracking number
- Save shipment information
- Upload supporting shipment images/documents

Status: Create

Phase 2 – Shipment Added

After the shipment is successfully created, it moves to the **Added** phase.

Key functions:

- Display newly created shipments
- Show shipment/tracking number
- Display sender and receiver information
- Display package details
- Show creation date and time
- Allow shipment information to be viewed
- Allow authorized users to edit or update shipment details
- Store uploaded images and documents

Status: Added

Phase 3 – Pickup

The shipment moves into the Pickup phase when the package is ready for collection.

Key functions:

- Assign pickup personnel
- Record pickup date and time
- Update pickup status
- Confirm package collection
- Record pickup location
- Update shipment tracking history

Status: Picked Up

Phase 4 – In Transit

After pickup, the shipment enters the transportation stage.

Key functions:

- Track shipment movement
- Display current shipment status
- Record transit locations
- Update shipment checkpoints
- Display estimated delivery information
- Maintain shipment history

Status: In Transit

Phase 5 – Out for Delivery

The shipment reaches the destination area and is assigned for final delivery.

Key functions:

- Assign delivery personnel
- Display delivery address
- Update delivery status
- Record delivery attempt
- Provide delivery progress information
- Notify relevant users of delivery progress

Status: Out for Delivery

Phase 6 – Delivered

The shipment is completed when the package has been successfully delivered.

Key functions:

- Confirm delivery
- Record delivery date and time
- Capture recipient confirmation/signature where applicable
- Store delivery proof
- Update tracking history
- Mark shipment as completed

Status: Delivered

3. Shipment Status Flow

Create → Added → Picked Up → In Transit → Out for Delivery → Delivered

Additional statuses may include:

- Pending
- On Hold
- Delivery Attempted
- Delayed

- Cancelled
- Returned

4. Image and Document Management

The Swift Ship Tracker should support attaching shipment-related images and documents throughout the appropriate phases.

Examples include:

- Package photographs
- Pickup proof
- Shipping labels
- Delivery proof
- Recipient confirmation
- Supporting documents

The uploaded WhatsApp images can be associated with the relevant shipment record and displayed in an image/document gallery.

5. Tracking Information

Each shipment should have a unique tracking number that allows authorized users to view:

- Shipment details
- Current status
- Shipment timeline
- Pickup information
- Transit updates
- Delivery information
- Uploaded images/documents
- Date and time of status changes

6. User Roles

Possible system roles include:

- **Admin** – Manage shipments, users, settings, and overall system information
- **Operator** – Create and update shipments
- **Pickup Staff** – Manage pickup activities
- **Delivery Staff** – Manage final delivery
- **Customer** – View shipment and tracking information

7. Phase Completion Criteria

A phase is considered complete when:

1. Required information has been entered.
2. The shipment status has been updated.
3. Relevant date/time information has been recorded.
4. Required images or documents have been uploaded.
5. The next shipment phase is available.
6. The shipment history reflects the completed activity.

8. Final Workflow

Create Shipment

Shipment Added

Pickup Confirmed

In Transit

Out for Delivery

Delivered

Shipment Completed

9. Project Goal

The goal of Swift Ship Tracker is to provide a clear and reliable end-to-end shipment workflow where every shipment can be created, updated, tracked, documented, and completed with a complete activity history.
